

Edenic Light Integrative Family Life Care

Functional Plasma Intracellular Reprogramming Comprehensive Therapy

By Dr. Shalomim Y. HaLahawi NMD

Optimal Wellness and Nutritional Evaluations consisting of Over 182 Tests. Includes Homotoxicology Therapy Plan: Lymph, Kidney, Liver, Heart, Pancreas, Lungs Chelation Detox, Psycho-metric rebalancing, Advanced Nutritional replenishment therapy & Cellular Reprogramming therapy. One of the Best Nutritional Therapy Programs Available from FDA/cGMP registered Pharmacies

For when the Doctors lab results conclude you are normal, but you still feel not so normal. You need to take it to the next level and dig deeper to find the root causes.

This package gives you a biochemically individualized road map to achieving optimal wellness. The core is an extensive laboratory work-up that includes:

Comprehensive Wellness Profile™:

Over 50 individual laboratory tests to provide a thorough Biochemical assessment of your health, and includes the basic cardiovascular tests as well as diabetes testing:

Lipid panel (cholesterol, HDL, LDL, the risk ratio, triglycerides)

Complete Blood Count (CBC's)

Fluids and Electrolytes

Thyroid Panel w/TSH

Liver Panel

Kidney Panel

Glucose (Diabetes)

Mineral and Bone

Urinalysis: Over 15 different items, this panel is useful in the evaluation of conditions such as urinary tract infection, dehydration, and kidney stones.

40-Amino Acid Panel(Plasma): Referred to as the "building blocks of life, Amino Acids make up proteins in every tissue of the body, and contribute to the formation of hormones, immunoglobulins, hemoglobin, collagen, muscles, neurotransmitters, enzymes, antibodies, and receptors and are involved in cellular energy production. They play a major role in nearly every chemical process that affects physical and mental function. Amino Acid deficiencies may manifest as fatigue, allergic sensitivity, arthritis, digestive disorder, cognitive function,

cardiovascular health, athletic performance, and neurologic imbalance.

Organic Acid Analysis: Urinary organic acid analysis of metabolic compounds, used in fundamental metabolic processes of the body, have proven useful in detecting nutrient deficiencies that precede acute functional impairment. Elevations of Methlymalonic acid and Homocysteine reflect B12 and folic acid insufficiencies.

The ONE consists of: Metabolic Analysis measuring 39 key organic acids to evaluate gastrointestinal function, cellular energy production, neurotransmitter processing, and functional need for vitamins, minerals, and co-factors.

Amino Acid Analysis measuring 38 amino acids to evaluate dietary protein adequacy, digestion, absorption, amino acid transport, metabolic impairments, and nutritional deficits; including essential vitamins, minerals, and amino acids.

Oxidative Stress Analysis is a sensitive tool to evaluate the body's anti-oxidant reserves and the presence of oxidative injury

Health Risk Assessment Report: The individual risk assessment is a guide to identify those behaviors that put you at risk for accidents or illness that if modified can increase the probability for a longer and healthier life. It provides measurable actionable information based on medically valid precursors—weight, tobacco use, or diet for example—and statistically valid scoring algorithms.

CellMate Report: Easy to read, extensive interpretations of the Comprehensive Wellness Profile (Comprehensive Wellness Profile) blood test results.

Complete therapy Program \$2950.00

Take Preventative measures against Cancer, Lupus, Heart Disease, Post Menopause Symptoms, rapid aging, chronic fatigue syndrome, mental fatigue, hormonal imbalances, uterine and urological imbalances, depression and other psychological problems, sexual dysfunction, stroke, high blood pressure, allergies, metabolic disorders etc!!!!
